Modelling, Simulation and Applications of Complex Systems

CoSMoS 2019, Penang, Malaysia,
April 8–11, 2019

 Springer

**Springer Proceedings in Mathematics &
Statistics**

Volume 359

This book series features volumes composed of selected contributions from workshops and conferences in all areas of current research in mathematics and statistics, including operation research and optimization. In addition to an overall evaluation of the interest, scientific quality, and timeliness of each proposal at the hands of the publisher, individual contributions are all refereed to the high quality standards of leading journals in the field. Thus, this series provides the research community with well-edited, authoritative reports on developments in the most exciting areas of mathematical and statistical research today.

Preface

This volume collects research papers and survey articles of participants and speakers in the Workshop on Complex Systems Modelling and Simulation 2019 (CoSMoS 2019): IoT and Big Data Integration, which was held in Penang, Malaysia, from 8–11 April 2019. The event was jointly organized by the School of Mathematical Sciences, Universiti Sains Malaysia (USM), Water Resource and Disaster Management (WARM) Vietnam, South East Asia Centre of Unité de Modélisation Mathématique et Informatique des Systèmes Complexes (UMMISCO France-Vietnam), the French Research Institute for Development (IRD) and Thuyloi University, Vietnam. CoSMoS 2019 had also attracted international delegates and participants from across the globe such as Japan, French, Bangladesh, Nigeria, Egypt, China, Indonesia, the Philippines, Myanmar, Vietnam and Malaysia.

The main topics highlighted during this international event were complex systems and agent-based modelling (ABM) incorporating elements of big data analytics and also Internet of things (IoT). Big data methods are often employed to discover potentially interesting patterns in large data sets, while ABM is an approach to investigate complex systems that arise in different real-life situations such as biology, engineering and socio-economic problems. This modelling framework often concentrates on the interactions of heterogeneous agents such as people, animals, vehicles and other entities, and sometimes interesting insights can emerge from the behaviours and also interactions of these agents at an individual scale. During this workshop, the potential of combining big data methods and IoT with those of ABM techniques was discussed in order to make a prediction about complex (biological, physical or engineering) systems and to support the decision-making process. One of the main targets in CoSMoS 2019 was to employ complex systems and ABM techniques together with big data and IoT approaches in order to solve the distinct problems faced by the local community and other parts of the world. Among the issues discussed during this workshop were transportation, agriculture and other real-life problems.

Consistent with the themes of CoSMoS 2019, the Springer PROMS volume entitled “Modelling, Simulation and Applications of Complex Systems - CoSMoS 2019, Penang, Malaysia, 8–11 April 2019” is put together and specially designed to

highlight some significant research results on broad disciplinary areas of complex systems. This edited volume takes into account a multidisciplinary approach in complex systems analysis that will encourage the transfer of ideas and methodology from modelling and simulation fields to the other areas of knowledge (and vice versa). In fact, one of the main highlights of this book is on the practical aspects of complex systems analysis in solving daily life problems faced by the local communities, government policy makers, industries and other relevant parties. Special attention is given to various applications on the techniques of complex systems in examining the transportation and mobility networks, social issues, epidemiology, ecological and conservation management, environmental problems, engineering and industrial applications. Many realistic biological and physical examples from recent research are employed in this book as illustrations. This book will be of interest to a broad readership including those interested in complex systems research and other related areas such as mathematical modelling, big data analytics, numerical simulation and agent-based modelling frameworks.

All authors contributing to the chapters in this book are in fact active researchers in the fields. The papers in this volume have also been through a rigorous refereeing process to ensure high scientific quality and standards. Through the publication of this edited volume, it will provide a platform for researchers from various scientific backgrounds the opportunity of disseminating recent research and knowledge in complex systems modelling and analysis. While other existing books in the fields often give more attention to a particular topic, this edited volume concentrates on the state-of-the-art research on complex systems in a broader sense. This is crucial to ensure that readers can grasp different concepts and ideas in complex systems research and also can demonstrate how the techniques from modelling and simulation and computational methods being employed to investigate the complexity of real-life systems. The development of new computational tools can improve our understanding of complex systems under consideration and highlight the emergent observations of complex biological and physical phenomena of interest.

We would like to thank all participants, course lecturers and invited speakers of the workshop for making the event a great success. Thanks to the organizing committee as well for their great efforts in conducting a well-run event. We are grateful to all the authors for their contributions to this volume and to all the reviewers for their timely and detailed feedbacks on the manuscripts. Additionally, we would like to extend our deepest gratitude to the School of Mathematical Sciences USM, WARM, UMMISCO, IRD France, Thuyloi University, Division of Academic and International USM, Division of Research and Innovation USM, Malaysian Mathematical Sciences Society (PERSAMA), Penang Convention and Exhibition Bureau (PCEB), Uni Paper Products Sdn. Bhd., Penang State Museum and Universiti Sains Malaysia Press for their valuable support and sponsorship to make the event successful.
