 SHLOMI DOLEV, Ben-Gurion University

This article describes an innovative Decision Support System (DSS) for Placement of Intrusion Detection and Prevention Systems (PIDPS) in large-scale communication networks. PIDPS is intended to support network security personnel in optimizing the placement and configuration of malware filtering and monitoring devices within Network Service Providers' (NSP) infrastructure, and enterprise communication networks. PIDPS meshes innovative and state-of-the-art mechanisms borrowed from the domains of graph theory, epidemic modeling, and network simulation. Scalable network exploitation models enable to define the communication patterns induced by network users (thereby establishing a virtual overlay network), and parallel attack models enable a PIDPS user to define various interdependent network attacks such as: Internet worms, Trojans horses, Denial of Service (DoS) attacks, and others. PIDPS incorporates a set of deployment strategies (employing graph-theoretic centrality measures) in order to facilitate intelligent placement of filtering and monitoring devices; as well as a dedicated network simulator in order to evaluate the various deployments. Experiments with PIDPS indicate that incorporating knowledge on the overlay network (network exploitation patterns) into the placement and configuration of malware filtering and monitoring devices substantially improves the effectiveness of intrusion detection and prevention systems in NSP and enterprise networks.

Categories and Subject Descriptors: G.2.2 [Discrete Mathematics]: Graph Theory—*Graph algorithms; Network problems*; G.3 [Probability and Statistics]: *Stochastic processes; Experimental design*; K.6.2 [Management of Computing and Information Systems]: Installation Management—*Benchmarks; Computing equipment management; Performance and usage measurement; Pricing and resource allocation*; K.6.5 [Management of Computing and Information Systems]: Security and Protection—*Invasive software (e.g., viruses, worms, Trojan horses)*

General Terms: Design, Experimentation, Security

Additional Key Words and Phrases: Overlay networks, intrusion detection, decision support systems
