Preface

This book presents a unified collection of concepts, tools, and techniques that constitute the most important technology available today for the design and implementation of information systems. The framework adopted for this integration goal is the one offered by the relational model of data, its applications, and implementations in multiuser and distributed environments. The topics presented in the book include conceptual modeling of application environments using the relational model, formal properties of that model, and tools such as relational languages which go with it, techniques for the logical and physical design of relational database systems and their implementations. The book attempts to develop an integrated methodology for addressing all these issues on the basis of the relational approach and various research and practical developments related to that approach.

This book is the only one available today that presents such an integration. The diversity of approaches to data models, to logical and physical database design, to database application programming, and to use and implementation of database systems calls for a common framework for all of them. It has become difficult to study modern database technology without such a unified approach to a diversity of results developed during the vigorous growth of the database area in recent years, let alone to teach a course on the subject.

It is quite clear that applications of the relational database technology are much more important to the majority of readers interested in that technology. However, knowledge about the underlying structures and algorithms, concurrency control protocols, and distributed processing techniques are becoming a common professional knowledge and are of interest not only to the implementors of such systems but also to all those readers—database

application programmers in particular—who would like to know how relational database systems actually work. On the other hand, implementors of such systems will benefit from the exposition of conceptual and relational modeling and end-user requirements and tools. Indeed, the most important implementation techniques for relational languages, for multiuser and distributed systems are presented within a framework that is an extension of the formal approach offered by various results developed around the relational model of data.

Although the book is based mainly on a collection of research papers, it is written as a textbook. This refers to the style of exposition, numerous examples which are used in the book, and an extensive set of exercises. Very little is assumed in terms of the required background. Some familiarity with the very basic concepts of modern mathematics, computer systems, and their common applications is, of course, necessary. The presentation of the basic theory of the relational model of data, its underlying relational structures and algorithms, transaction processing models, and distributed systems is sometimes formal and very technical, but it is always illustrated by very pragmatic examples.

In addition to the described integration goal the book is different from existing ones in that it applies recent object-action oriented techniques for conceptual modeling within the relational framework, and it provides a thorough exposition of the most important issues—particularly those related to data integrity—involved in the design and implementation of multiuser and distributed database systems.

The author acknowledges research support from SIZ nauke SR Bosne i Hercegovine, and valuable observations made by Mario Gaon.

Contents

Introduction	1
1 Modeling Application Environments	1
2 Relational Model	5
3 Relational Database System	11
4 Relational Technology	17
CHAPTER 1	
Data Model	20
1 Relational Model of Data	20
1.1 Relational Representation of Entities	20
1.2 Relational Algebra	24
1.3 Relational Query Languages	29
2 Logical Dependencies	36
2.1 Functional Dependencies	36
2.2 Multivalued Dependencies	41
2.3 Join Dependencies	47
3 Hierarchical and Network Models	48
3.1 Unnormalized Relational Schemas	48
3.2 Network Model	51
Exercises: GROUP BY Clause; SET Function; Entity	
Relationship Diagrams; Generalized Joins; $M : N$ Relationships;	
Lossless Joins	56
Bibliographical Notes	63
CHAPTER 2	
Logical Design	64
1 Normal Forms	64
1.1 Second Normal Form (2NF)	65

1.2	Third Normal Form (3NF)	68
1.3	Boyce-Codd Normal Form (BCNF)	72
1.4	Fourth Normal Form (4NF)	75
1.5	Projection/Join Normal Form (PJNF)	79
2	Abstractions	82
2.1	Unnormalized Relational Model	82
2.2	Aggregation	84
2.3	Generalization	88
3	Design Methodology	92
3.1	Extended Relational Model	92
3.2	Relational Database Programming Environment	95
3.3	Conceptual Modeling	107
	Exercises: Views; Types of Database Entities; Generalization; Associations; Aggregation; Characterization; Cover Aggregation; Taxonomic Design Methodology; Exception Modeling;	
	Exception Handling	118
	Bibliographical Notes	130
 CHAPTER 3		
	Structural Design	131
1	Relational Images	131
2	Decomposition of Unary Queries	135
3	Decomposition of Binary Queries	141
4	Optimization of Binary Queries	146
5	Decomposition of Queries with Set Operators	149
6	Relational Representation of Relations and Their Images	152
7	Decomposition of Data Manipulation Statements	153
8	Structure of Images	156
	Exercises: Links; Network Structures; Decomposition of n -ary Queries; Optimization of Query Expressions; Properties of the Relational Operators; B*-Trees	
	Bibliographical Notes	162 172
 CHAPTER 4		
	Data Integrity	173
1	Transactions and Integrity of Data	173
2	Concurrent Executions of Transactions	175
3	Locking Protocols	179
4	Logical Locks	188
5	Restoring a Consistent Database State	197
	Exercises: Assertions; Transactions; Triggers; Tree Protocol; Hierarchical Locking Protocol	
	Bibliographical Notes	205 210
 CHAPTER 5		
	Distributed Technology	212
1	Architecture of Database Systems	212
2	Distributed Executions and Integrity	216

Contents	xi
3 Distributed Query Processing	222
4 Distributed Updating	231
Exercises: Fragmentation; Transaction Structure; Integrity Constraints and Data Distribution; Generalization and Fragmentation; Multidatabase Systems; Catalog Management; Object Naming	237
Bibliographical Notes	244
References	245
Index	249
