Preface

The International Cross Domain Conference for Machine Learning & Knowledge Extraction CD-MAKE is a joint effort of IFIP TC 5, TC 12, IFIP WG 8.4, IFIP WG 8.9 and IFIP WG 12.9, and is held in conjunction with the International Conference on Availability, Reliability and Security (ARES) – this time in beautiful Vienna, Austria, during August 23–26, 2022. Thanks to the current improved situation of the COVID-19 pandemic, which affected us all heavily, we were happy that we could meet all our international colleagues and friends in person again.

For those who are new to our conference, the letters CD in CD-MAKE stand for “Cross-Domain” and describe the integration and appraisal of different fields and application domains to provide an atmosphere to foster different perspectives and opinions. We are strongly convinced that this cross-domain approach is very fruitful for new developments and novel discoveries. The conference fosters an integrative machine learning approach, considering the importance of data science and visualization for the algorithmic pipeline with a strong emphasis on privacy, data protection, safety, and security. It is dedicated to offering an international platform for novel ideas and a fresh look on methodologies to put crazy ideas into business for the benefit of humans. Serendipity is a desired effect for the cross-fertilization of methodologies and transfer of algorithmic developments.

The acronym MAKE stands for “MACHINE Learning and Knowledge Extraction”, a field of artificial intelligence (AI) that, while quite old in its fundamentals, has just recently begun to thrive based on both novel developments in the algorithmic area and the availability of vast computing resources at a comparatively low cost.

Machine learning (ML) studies algorithms that can learn from data to gain knowledge from experience and to generate decisions and predictions. A grand goal is in understanding intelligence for the design and development of algorithms that work autonomously (ideally without a human-in-the-loop) and can improve their learning behavior over time. The challenge is to discover relevant structural and/or temporal patterns (“knowledge”) in data, which is often hidden in arbitrarily high dimensional spaces, and thus simply not accessible to humans. Knowledge extraction is one of the oldest fields in AI and is seeing a renaissance, particularly in the combination of statistical methods with classical ontological approaches.

AI is currently undergoing a kind of Cambrian explosion and is the fastest growing field in computer science today thanks to the successes in machine learning to help to solve real-world problems. There are many application domains, e.g., in agriculture, climate research, forestry, etc. with many use cases from our daily lives, which can be useful to help to solve various problems. Examples include recommender systems, speech recognition, autonomous driving, cyber-physical systems, robotics, etc.

However, in our opinion the grand challenges are in sensemaking, in context understanding, and in decision making under uncertainty, as well as solving the problems of human interpretability, explainability, and verification.

Our real world is full of uncertainties and probabilistic inference enormously influences AI generally and ML specifically. The inverse probability allows us to infer unknowns, to learn from data, and to make predictions to support decision-making. Whether in social networks, recommender systems, health applications, or industrial applications, the increasingly complex data sets require a joint interdisciplinary effort bringing the human-in-control and to manage ethical and social issues, accountability, retractability, explainability, causability and privacy, safety, and security!

The International Federation for Information Processing (IFIP) is the leading multinational, non-governmental, apolitical organization in information and communications technologies and computer sciences. IFIP is recognized by the United Nations (UN) and was established in 1960 under the auspices of UNESCO as an outcome of the first World Computer Congress held in Paris in 1959.

IFIP is incorporated in Austria by decree of the Austrian Foreign Ministry (September 20, 1996, GZ 1055.170/120-I.2/96) granting IFIP the legal status of a non-governmental international organization under the Austrian Law on the Granting of Privileges to Non-Governmental International Organizations (Federal Law Gazette 1992/174). IFIP brings together more than 3500 scientists without boundaries from both academia and industry, organized in more than 100 Working Groups (WGs) and 13 Technical Committees (TCs).

To acknowledge all those who contributed to the efforts and stimulating discussions at CD-MAKE 2022 would be impossible in a preface like this. Many people contributed to the development of this volume, either directly or indirectly, so it is impossible to list all of them. We herewith thank all local, national, and international colleagues and friends for their positive and supportive encouragement. Finally, yet importantly, we thank the Springer management team and the Springer production team for their professional support. This year CD-MAKE received 45 submissions, which all have been carefully reviewed by our program committee in a double-blind review. Finally 23 papers have been accepted and were presented at the conference in Vienna.

Thank you to all! Let's MAKE it cross-domain!
