Behaviormetrics: Quantitative Approaches to Human Behavior

Volume 7

Series Editor

Akinori Okada, Professor Emeritus, Rikkyo University,
Tokyo, Japan

This series covers in their entirety the elements of behaviormetrics, a term that encompasses all quantitative approaches of research to disclose and understand human behavior in the broadest sense. The term includes the concept, theory, model, algorithm, method, and application of quantitative approaches from theoretical or conceptual studies to empirical or practical application studies to comprehend human behavior. The Behaviormetrics series deals with a wide range of topics of data analysis and of developing new models, algorithms, and methods to analyze these data.

The characteristics featured in the series have four aspects. The first is the variety of the methods utilized in data analysis and a newly developed method that includes not only standard or general statistical methods or psychometric methods traditionally used in data analysis, but also includes cluster analysis, multidimensional scaling, machine learning, corresponding analysis, biplot, network analysis and graph theory, conjoint measurement, biclustering, visualization, and data and web mining. The second aspect is the variety of types of data including ranking, categorical, preference, functional, angle, contextual, nominal, multi-mode multi-way, contextual, continuous, discrete, high-dimensional, and sparse data. The third comprises the varied procedures by which the data are collected: by survey, experiment, sensor devices, and purchase records, and other means. The fourth aspect of the Behaviormetrics series is the diversity of fields from which the data are derived, including marketing and consumer behavior, sociology, psychology, education, archaeology, medicine, economics, political and policy science, cognitive science, public administration, pharmacy, engineering, urban planning, agriculture and forestry science, and brain science.

In essence, the purpose of this series is to describe the new horizons opening up in behaviormetrics — approaches to understanding and disclosing human behaviors both in the analyses of diverse data by a wide range of methods and in the development of new methods to analyze these data.

Editor in Chief

Akinori Okada (Rikkyo University)

Managing Editors

Daniel Baier (University of Bayreuth)

Giuseppe Bove (Roma Tre University)

Takahiro Hoshino (Keio University)

Preface

This monograph originates from the long scientific collaboration between the three Authors on the subject of asymmetry in multidimensional scaling and cluster analysis, through many international meetings and workshops. An initiative of this collaboration was the Special Issue of the journal *Advances in Data Analysis and Classification* entitled *Analysis of Asymmetric Relationships*, published in the year 2018, now followed by this monograph.

The idea is not to write a second book on asymmetric structures of data analysis after the comprehensive exposition of Saito and Yadohisa (2005), but rather an agile monograph on the subject oriented to application in behavioural sciences. Many researchers in different fields collect proximity data such as brand switching or import–export data, flows and migration data and sociomatrices and need methods to explore the structure of their data. Therefore, the monograph is primarily intended as an updated overview of methods available for studying and analysing asymmetric relationships with a special focus on the practical relevance of the methods presented. Methods and results are always accompanied by illustrative graphical representations through real-life examples to be understandable to non-mathematicians and practitioners. The focus is on conceptual understanding and practical know-how rather than mathematical formalization and proofs. Specialized software is provided or referenced to in the final sections of some chapters, to help the computation of some of the models presented. The monograph can be also useful for graduate students interested in asymmetry in different fields of applications. Guidelines for reading are provided in Sect. 1.4.

We are indebted to many people we have shared time with to discuss asymmetry when preparing joint research papers or attending conferences in the last decades. Particularly useful and stimulating were the joint meetings and sessions organized between the Japanese and the Italian Groups of Classification and Data Analysis in 2012.

Special thanks go to Dr. Alessio Serafini for supporting the preparation of some R scripts and for discussing the software sections, to Prof. Tadashi Imaizumi for his help in preparing Sect. 5.5, and to Prof. Mark de Rooij who, with his careful reading, provided detailed and valuable suggestions that made the volume more understandable and accurate. The second author thanks Yosuko Hase for her help in English in Chap. 5.

Contents

1	Introduction	1
1.1	Historical Background	1
1.2	Types of Asymmetric Pairwise Relationships, Proximity Definition and Related Basic Concepts	6
1.3	Examples of Asymmetric Proximity Matrices	13
1.4	Aims and Overview of the Book	20
	References	22
2	Methods for Direct Representation of Asymmetry	27
2.1	Preliminaries	27
2.2	Bilinear Methods	34
2.3	Distance-like Models	44
2.3.1	Main Concepts on Distance Representation of Symmetric Proximities	44
2.3.2	Distance Representation of Asymmetry	49
2.4	External Information	56
2.5	Applications	58
2.5.1	Bilinear Model on European Languages Data	58
2.5.2	Distance Representations of Managers Data	60
2.6	Software	68
2.6.1	Bilinear Methods	69
2.6.2	Distance Representation of Asymmetry	71
	References	74
3	Analysis of Symmetry and Skew-Symmetry	77
3.1	Preliminaries	77
3.2	Separate Representation	81
3.2.1	One-dimensional Skew-Symmetry	87
3.2.2	Distance Models for Skew-Symmetry*	90
3.3	Joint Representation	93
3.3.1	Independent Modelling of Symmetry and Skew-Symmetry	93

3.3.2	Dependent Modelling of Symmetry and Skew-Symmetry	96
3.4	Overview and Strategies of Analysis	101
3.5	Applications	102
3.6	Software	110
3.6.1	Distance Model	110
3.6.2	SVD of the Skew-Symmetric Component	111
3.6.3	Distance model plus radii for the skew-symmetric component	112
3.6.4	Joint Representation	113
References	117
4	Cluster Analysis for Asymmetry	119
4.1	Preliminaries	119
4.2	Hierarchical Methods	126
4.2.1	Asymmetric Hierarchical Algorithms and Dendrograms	126
4.2.2	Independent Modelling of Symmetry and Skew-Symmetry	130
4.3	Non-hierarchical Methods	132
4.3.1	Joint Modelling Symmetry and Skew-Symmetry	133
4.3.2	Including External Information: CLUSKEXT Model	139
4.3.3	Modelling Asymmetries Between Clusters	143
4.3.4	Dominant Object Approach	146
4.4	Clustering Approaches for Two-Mode Two-Way Data*	148
4.5	Applications	149
4.5.1	Managers Data	149
4.5.2	European Languages Data	153
References	158
5	Multway Models	161
5.1	Preliminaries	161
5.2	Two-Mode Three-Way Asymmetric Methods	164
5.2.1	INDSCAL Model	165
5.2.2	Representing Asymmetry by Relationships Among Objects	167
5.2.3	Representing Asymmetry by Relationships Among Dimensions	176
5.3	One-Mode Three-Way Asymmetric Methods	177
5.4	Applications	180
5.5	Software	192
